

Nosocomial Infections (Illness Acquired in Hospitals)

Five percent(5%) of people that enter a hospital acquire nosocomial infections. Of that, ten percent(10%) subsequently dies. That means that one of every two-hundred (1 of 200) people that enter a hospital will die of nosocomial infections. Conservative estimates put the economic cost to the hospital at over one million dollars annually for a 250-bed hospital, not including money lost in litigation to families of the deceased.

Hospital operators, surgeons, and physicians face the possibility of patient litigation, which can ruin a reputation and even bankrupt a practice.

HVAC (heating and air) systems are the primary vehicle for the spread of toxic molds in most indoor environments.

Inadvertently, medical facilities create the ideal breeding ground for biological contaminants (ie: bacteria, fungi, viruses, etc.) in the HVAC systems. Ventilation systems are not only the source of the contamination, but also the vehicle that distributes the pathogens throughout the hospital. Disinfection of the entire facility on a regular basis is critical, and measures must be taken to prevent the return of such life threatening bio-toxins.

The elimination of these toxins from of the HVAC systems in hospitals has proven to substantially reduce the number of nosocomial infections overnight. In cases where AAF was utilized for bio-disinfection, the numbers of nosocomial infections were reduced to virtually no reported cases.

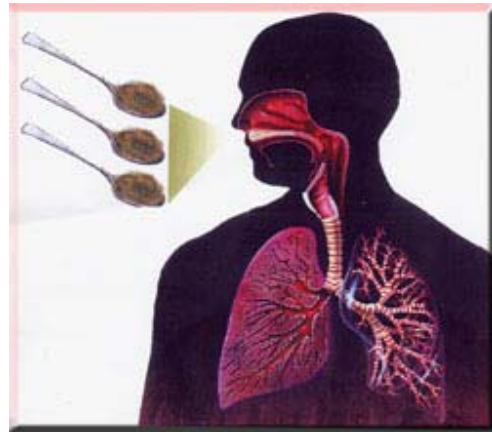

AAF can coordinate with hospital administrators to provide bio-disinfection services with little (or no) disruption of patient care. AAF has developed infection control specifications that have been approved and used in military hospitals and health departments.

**Why Do You and Your Family Get Sick?
Maybe Your Environment is Sick!**
Do you feel sick at Home? at Work? at School?

Between your home, work, and any other indoor environments you spend time in, you will breathe an average three tablespoons of airborne particles during both day time and sleeping hours.

Airborne contaminants that you breathe every day:

- Dust mites
- Molds
- Pollen
- Bacteria
- Yeast
- Chemicals
- Construction Debris
- Insect Fragments
- Animal Byproducts
- Viruses
- Fibrous Insulation
- Tobacco Smoke

When airborne mold spores enter your lungs, your body goes into a defensive mode to prevent infection. Many of the molds that negatively effect us continue to reproduce inside our lungs. When your immune system is defending itself from your every day environment, it has no time to recuperate. Many of the drugs we take today harm our immune system, by destroying HELPful bacteria that co-exist in our bodies. When an immune system is weakened it is unable to ward off infections and diseases.

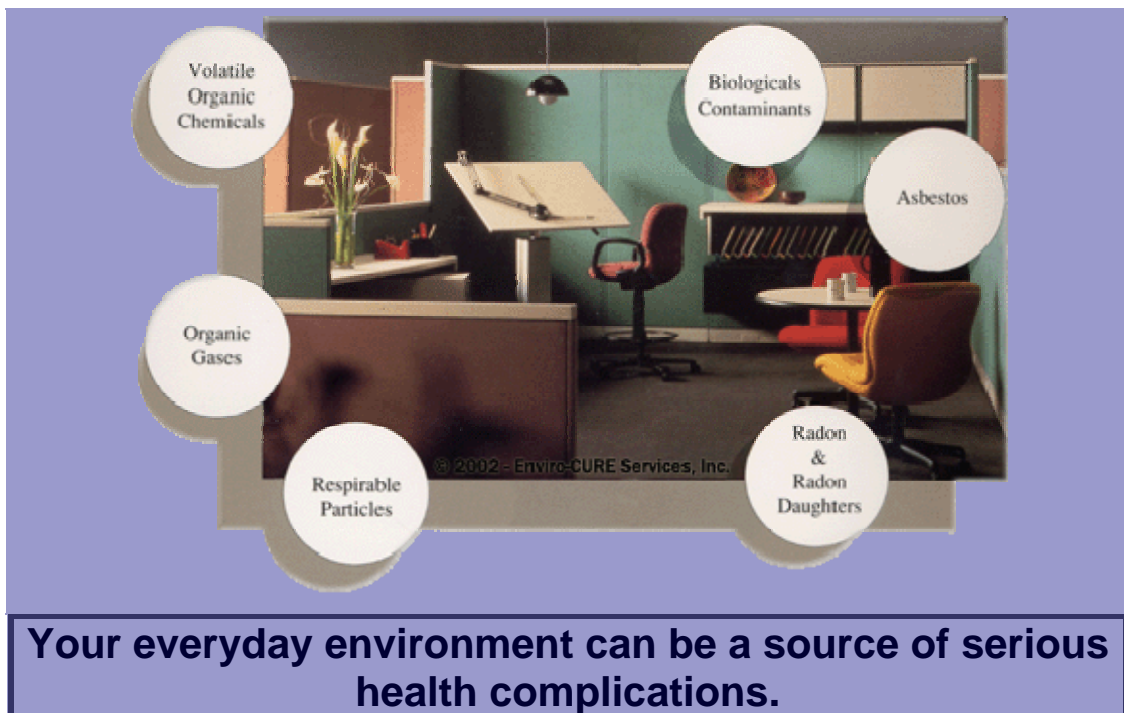

If you suffer from any of the following sickness:

asthma
allergies
headaches
ear infections
eye infections
congestion
vomiting

weakness
frequent colds
skin infections
sinus infections
throat infections
respiratory infections
Sleep Apnea

flu
diarrhea
dizziness
impotence
memory loss
hair loss
Eczema

Then chances are you are symptoms will worsen.

Continued exposure to bio-contaminants will lead to life-threatening diseases including:

Lupus
Cancer
Leukemia
Fibromyalgia

Tuberculosis
Pneumoconiosis
Epstein-Barr Virus
Legionnaire's Disease
Neurological Ailments
Chronic Fatigue Syndrome
Heart and Respiratory Diseases
Sudden Infant Death Syndrome (SID)
Multiple Chemical Sensitivities (M.C.S.)

**"NO remedy or treatment can be effective UNTIL
the source has been eliminated."**

Our goal at AAF is to provide the public with the tools, knowledge, and assistance that is necessary to achieve the healthiest possible living environment.

AAF has effectively combated airborne infections and disease, specifically from toxic molds, for over 10 years. We have stopped hospital epidemics, saved school children, eliminated bio-hazards in commercial buildings, and residential homes. Our expertise has saved the lives of thousands of people who suffered needlessly due to mold and bacteria infections caused by sources in their buildings.

Most of our now healthy clients never considered that they were poisoned by their work or home until learning about our organization and using our services.

AAF can inspect your medical facility, discover the sources of the health complaints, and completely remove the bio-hazard. We have developed custom procedures, EPA approved chemicals, and safety equipment that allow us to completely bio-disinfect your indoor work and living environment. In addition, we have developed testing procedures that allow you to inexpensively test your home and receive a professional laboratory analysis of the results. Our tools, methods, and services have been tested and certified by us to provide solutions that allow us to **GUARANTEE** positive results for you, your patients and your family.
